Platform assessment
WeBull

31 July 2026 · prepared by Bruntsfield Advisory Network

The business

WeBull is a technology-led retail brokerage. It competes on the quality of the trading experience — data, charting, execution and low headline cost — rather than on holding a broad financial relationship with its customers.

The customer it wins is the customer who cares what the platform does, which is a smaller population than a bank's and a considerably more demanding one. Revenue follows activity rather than balances, so the business is more sensitive to how much its customers trade than to how much they hold.

Where the advantage sits

The advantage is the platform itself. The infrastructure underneath the product is genuinely strong, and in a market where most competitors treat the trading stack as a cost centre, treating it as the product is a real position.

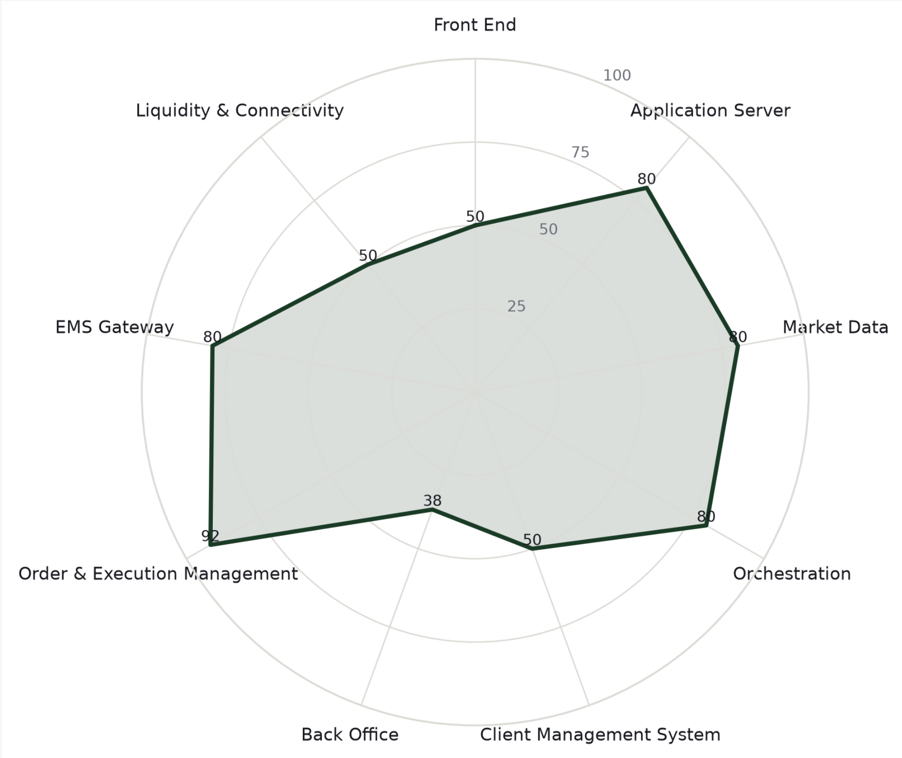
That advantage is closest in kind to process power: it comes from accumulated engineering rather than from a contract, a brand or a network, which makes it durable while it is maintained and perishable if it is not.

Brand strength is materially behind the incumbents in every market the firm operates in, and this report does not treat product quality as though it were brand. They behave differently under pressure.

What is holding it back

The constraint is customer acquisition, not capability. The firm has built a platform better than its share of the market, which is the signature of a distribution problem rather than a product one.

Because revenue follows activity, the firm is also exposed to the trading cycle in a way a fee-led platform is not. A quiet market reduces revenue without reducing the cost of running the infrastructure that produced the advantage in the first place.



Module maturity across the assessed modules (0–100).

What to do about it

Convert platform quality into something a customer can perceive before they become a customer. Advantages that only reveal themselves after acquisition are advantages that cannot help acquisition.

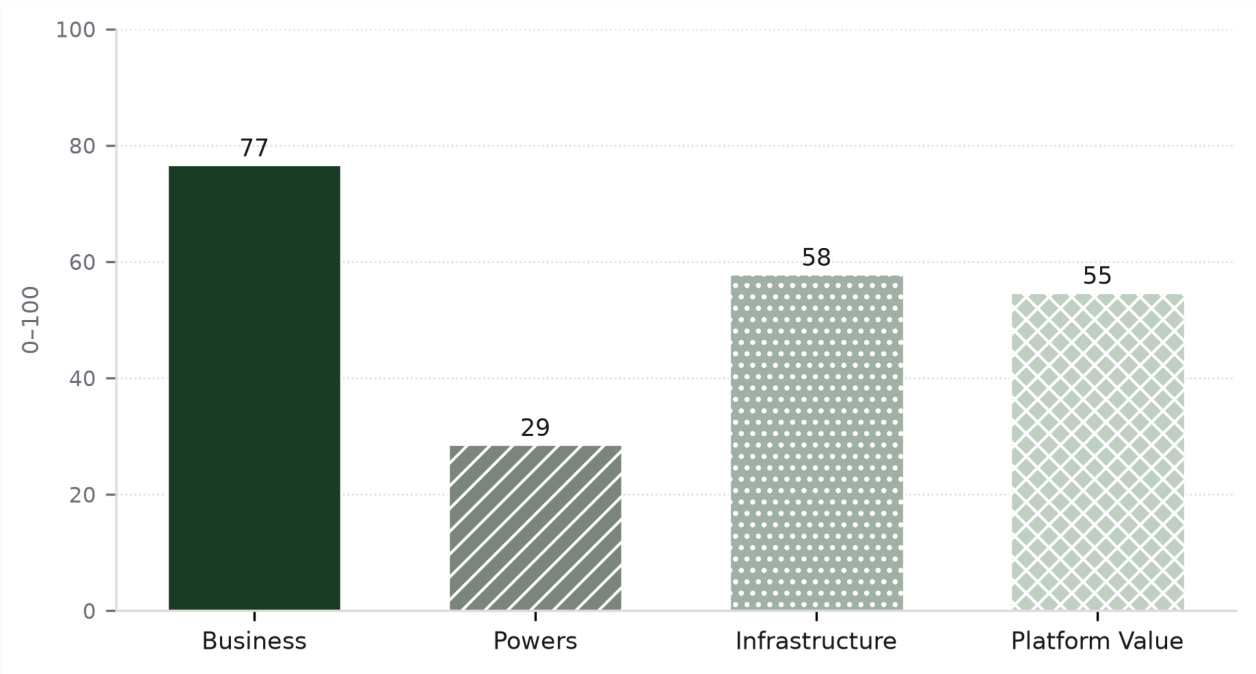
Second, build a reason for a customer to hold assets rather than only to trade them. That is the change that decouples revenue from the cycle, and it is a product decision rather than a marketing one.

Third, defend the engineering advantage deliberately. Process power decays quietly, and a firm whose whole position rests on it should be measuring that decay rather than assuming the lead holds.

What that is worth

The value of acting here is asymmetric. The platform investment is already made, so the return on solving distribution is unusually high — and the cost of not solving it is that the investment quietly stops earning.

The appendix figures show exactly this shape: infrastructure scoring well above the commercial position built on it. Where those two diverge, the smaller one is the constraint.



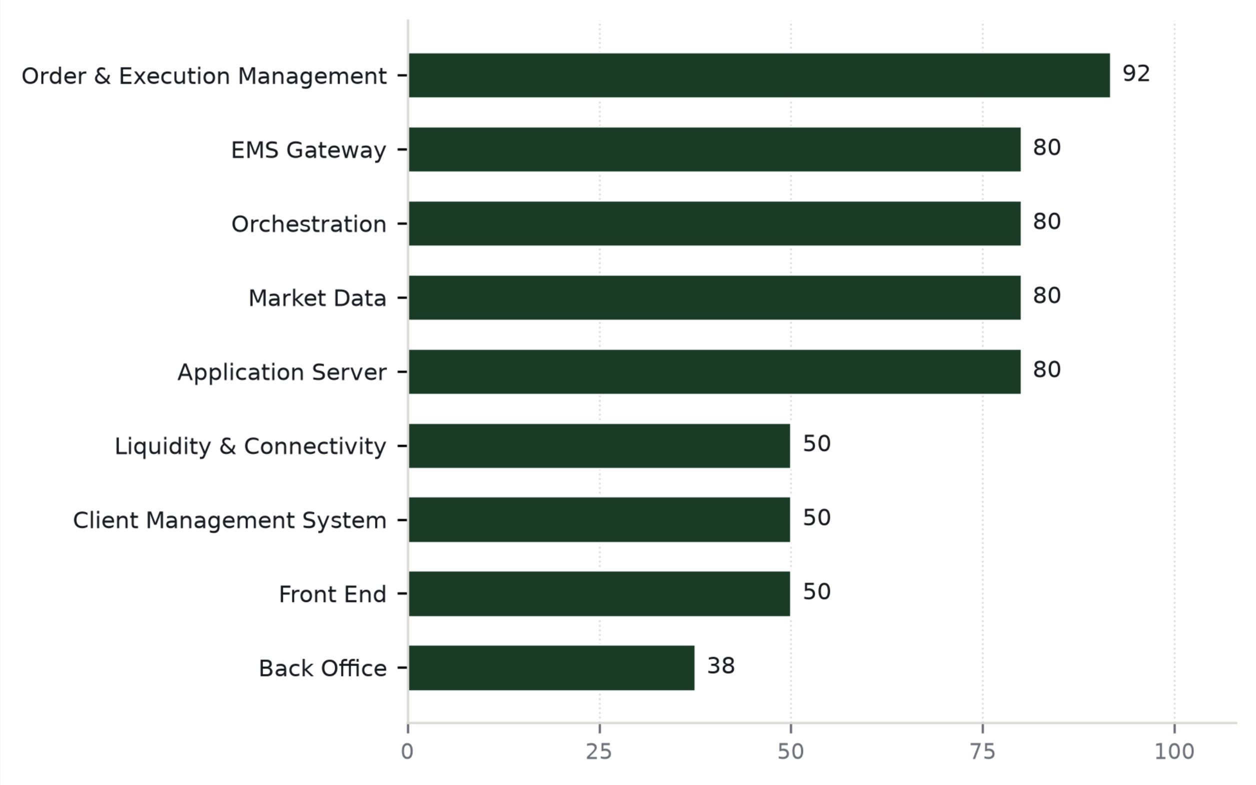
How Platform Value builds up from the underlying indices.

Technical appendix

Everything the narrative refers to, with the versions that produced it. The story ends here; what follows is the arithmetic behind it.

This is an illustrative example record, built from published information, and it is not a client engagement. It is seeded so that a new advisor can see a complete report end to end; every rendition of it is watermarked accordingly.

The figures below come from the scoring run this report is bound to. The methodology and coefficient versions that produced them are stated in the footer of every rendition, and the run is immutable, so this appendix and the document you are holding cannot drift apart.



Every assessed module, weakest first. Unassessed modules are omitted, not scored zero.

Every figure quoted in this report

Figure	Value	Source
Methodology version	`1.1`	`run.methodology_version`
Coefficient set version	`v1-draft-pending-elicitation`	`run.coefficient_version`
Engine version	`0.1.0`	`run.engine_version`
Platform Value (0–100)	`55`	`run.v_display_0_100`

Figure	Value	Source
Front End (0–100)	50	run.modules.FRONTEND.q_m
Application Server (0–100)	80	run.modules.APP_SERVER.q_m
Market Data (0–100)	80	run.modules.MARKET_DATA.q_m
Orchestration (0–100)	80	run.modules.ORCHESTRATION.q_m
Client Management System (0–100)	50	run.modules.CMS.q_m
Back Office (0–100)	38	run.modules.BACKOFFICE.q_m
Order & Execution Management (0–100)	92	run.modules.OEMS.q_m
EMS Gateway (0–100)	80	run.modules.EMS_GATEWAY.q_m
Liquidity & Connectivity (0–100)	50	run.modules.LIQ_CONNECT.q_m
