

Deutsche Börse

Platform assessment

Q3 platform review

30 July 2026 · prepared by J. Gallagher

The business

Deutsche Börse runs a regulated exchange and the clearing and settlement rails beneath it. It earns from trading fees, from clearing, and — increasingly — from selling the data its own venue generates. The third of those is the quiet one, and it is the one that compounds.

That mix matters for everything that follows. A venue earns its position from liquidity, and liquidity is the hardest thing on this list to buy.

Where the advantage sits

Read through the 7 Powers, the durable position here is network economies: order flow attracts order flow, and a rival venue must overcome that before price even enters the conversation.

Scale economies follow from it rather than standing alone. Where the firm has no real defence is in switching costs on the data side, which is a commercial choice rather than a structural fact.

What is holding it back

The binding constraint is not the market position. It is operational: the weakest assessed module drags the composite, and it is the one a competitor would probe first.

Module maturity across the assessed modules (0–100).

What to do about it

Three moves, in order. Close the operational gap that is capping the score. Convert the data relationship into something with switching costs. Then price the venue position deliberately, rather than defending it reactively.

What that is worth

Platform Value stands at 48 today. Acting on the three moves above is what moves it, and the ordering matters more than the pace: the operational gap gates the other two.

How Platform Value builds up from the underlying indices.

Technical appendix

Everything the narrative refers to, with the versions that produced it. The story ends here; what follows is the arithmetic behind it.

Scores are computed per ATLAS methodology. Uncertainty is modelled as a P10/P50/P90 band around the deterministic point estimate; where inputs carried no confidence grade the band is reported as an unmodelled point rather than a falsely tight range.

Modules with no assessed subcomponent are excluded from every aggregate. They are never scored as zero, which would understate a firm for being unmeasured rather than weak.

Every assessed module, weakest first. Unassessed modules are omitted, not scored zero.

Every figure quoted in this report

Figure	Value	Source
Methodology version	1.1	run.methodology_version
Coefficient set version	v1-draft-pending-elicitation	run.coefficient_version
Engine version	0.1.0	run.engine_version
Platform Value (0–100)	48	run.v_display_0_100
Front End (0–100)	44	run.modules.FRONTEND.q_m

Figure	Value	Source
Application Server (0–100)	62	<code>run.modules.APP_SERVER.q_m</code>
