The business

Revolut sells banking, foreign exchange and investing to retail customers through a single mobile application. Trading is one surface among several rather than the whole proposition, and that shapes everything else in this report: the firm acquires a customer for one job and monetises them across many.

The economics follow from distribution rather than from execution. Revolut's advantage over a specialist broker is that it already holds the customer relationship and the balance; its disadvantage is that trading is competing internally for engineering attention with cards, credit, savings and business banking.

Where the advantage sits

The durable advantage is brand and distribution. Revolut is a recognised consumer name in markets where most brokers are not, and it acquires investing customers at a cost a standalone platform cannot match because the acquisition has already happened for another product.

Counter-positioning is real but partial. An incumbent broker cannot easily copy the multi-product app without disrupting the revenue it already has, which is the shape of a genuine strategic barrier. What is not yet durable is switching cost: a customer's holdings are portable and the relationship, while broad, is not deep in the way a full wealth relationship becomes.

Network effects are present at the payments layer and largely absent at the investing layer. The report does not credit the second to the first.

What is holding it back

The binding constraint is the depth of the trading platform relative to the breadth of the franchise. The front end and the application layer are strong; the order and execution management underneath them is thinner than the customer numbers would lead an observer to expect.

That gap does not hurt while the average customer trades occasionally in liquid instruments. It begins to hurt the moment the firm wants the customers it already has to trade more, or to trade products where execution quality is visible. The constraint is therefore not a problem the firm has today; it is the ceiling on the strategy the firm has announced.

Module maturity across the assessed modules (0–100).

What to do about it

Deepen the execution layer before marketing the trading proposition harder. The order in which those two happen decides whether increased engagement is met with capability or with incidents.

Second, make the switching cost real by moving from custody of assets to ownership of the customer's financial picture — tax reporting, cost basis and planning are the surfaces that make leaving expensive, and they are cheaper to build than execution infrastructure.

Third, treat the multi-product advantage as a strategic asset to be defended rather than a fact to be assumed. It is the thing an incumbent cannot copy quickly, and it is the thing a better-funded neobank could.

What that is worth

The value of closing the execution gap is not primarily new revenue from trading. It is the removal of a ceiling on a strategy the firm is already spending to pursue, which makes it a cost of preserving the value already built rather than an investment in new value.

Read the appendix figures in that light. The headline index measures the platform as it stands; the range around it reflects how much of this assessment rests on published information rather than

on inspection.

How Platform Value builds up from the underlying indices.

Technical appendix

Everything the narrative refers to, with the versions that produced it. The story ends here; what follows is the arithmetic behind it.

This is an illustrative example record, built from published information, and it is not a client engagement. It is seeded so that a new advisor can see a complete report end to end; every rendition of it is watermarked accordingly.

The figures below come from the scoring run this report is bound to. The methodology and coefficient versions that produced them are stated in the footer of every rendition, and the run is immutable, so this appendix and the document you are holding cannot drift apart.

Every assessed module, weakest first. Unassessed modules are omitted, not scored zero.

Every figure quoted in this report

Figure	Value	Source
Methodology version	1.1	run.methodology_version
Coefficient set version	v1-draft-pending-elicitation	run.coefficient_version
Engine version	0.1.0	run.engine_version
Platform Value (0–100)	60	run.v_display_0_100

Figure	Value	Source
Front End (0–100)	82	<code>run.modules.FRONTEND.q_m</code>
Application Server (0–100)	80	<code>run.modules.APP_SERVER.q_m</code>
Market Data (0–100)	50	<code>run.modules.MARKET_DATA.q_m</code>
Orchestration (0–100)	80	<code>run.modules.ORCHESTRATION.q_m</code>
Client Management System (0–100)	50	<code>run.modules.CMS.q_m</code>
Back Office (0–100)	80	<code>run.modules.BACKOFFICE.q_m</code>
Order & Execution Management (0–100)	38	<code>run.modules.OEMS.q_m</code>
